What is a series & parallel configuration for 18650 & 21700 batteries?

This comprehensive guide will explore the intricacies of series and parallel configurations for 18650 and 21700 cells, helping you determine the best setup for your specific needs. In a series configuration, batteries are connected end-to-end, with the positive terminal of one cell connected to the negative terminal of the next.

How do you calculate the number of cells in a battery pack?

To calculate the number of cells in a battery pack, both in series and parallel, use the following formulas: 1. Number of Cells in Series (to achieve the desired voltage):  $\text{Number of Series Cells} = \text{Desired Voltage} / \text{Cell Voltage}$  2. Number of Cells in Parallel (to achieve the desired capacity):

What is the cells per battery calculator?

Show Your Love: The Cells Per Battery Calculator is a tool used to calculate the number of cells needed to create a battery pack with a specific voltage and capacity. When designing a battery pack, cells can be connected in two ways: in series to increase voltage, or in parallel to increase capacity.

How many cells in a battery pack?

Step 3: Calculate the total number of cells:  $\text{Total Cells} = \text{Number of Series Cells} * \text{Number of Parallel Cells}$   
 $\text{Total Cells} = 7 * 6 = 42$  cells So, you would need 42 cells in total to create a battery pack with 24V and 20Ah using cells with 3.7V and 3.5Ah. 1. Why do I need to connect cells in series for voltage?

What is a series battery?

In a series configuration, batteries are connected end-to-end, with the positive terminal of one cell connected to the negative terminal of the next. This arrangement has the following effects: Example: Four 3.7V cells in series would produce 14.8V ( $4 * 3.7V$ ) with the same capacity as a single cell.

How many Mah can a 4s2p battery pack have?

Example: Four 3000mAh cells in parallel would have a total capacity of 12000mAh ( $4 * 3000\text{mAh}$ ) at the same voltage as a single cell. Many battery packs use a combination of series and parallel connections to achieve the desired voltage and capacity. For example, a 4S2P configuration would have two parallel groups of four cells in series.

Capacity remains the same: When the batteries are connected in series, the overall capacity (measured in ampere-hours - Ah, or milliamp-hours - mAh) remains the same as is of an individual battery. If you connect two 35Ah batteries, the total capacity will remain 35Ah. Current flows through all connected batteries.

This configuration means the e-bike battery pack consists of 10 cells in series and it also has 3 series in parallel. 10S3P translates to a series connection of 10 cells. This provides a higher voltage.

Number of parallel cells:  $20\text{Ah}/2\text{Ah}=10$ , that is, 10 parallel (10 cells are connected in parallel to increase battery capacity) Number of series:  $48\text{V}/3.7\text{V}=12.97$ , that is, 13 parallel (13 batteries need to be connected in series to increase the voltage) The whole set of batteries is 13 strings  $\times$  10 batteries = 130 batteries

The other thing to factor in as well is which battery chemistry you will use. These small cells can come in LiFePO4 which are 3.2v and also come in the high-energy density automotive cobalt chemistry ones which are 3.6v so that influences how many series cells you want 8s vs 7s (for a 24v bank), and thus which BMS's you might be looking for.
