To calculate the current draw from a 3000-watt inverter, follow these steps: Determine Voltage: Identify the operating voltage of your system (e.g., 12V, 24V, or 48V). Use the Formula: Apply the formula mentioned ...

The efficiency of the inverter is not always 100% but sometimes 80%, 85%, and 90%, this is because it depends on the inverter type and design, load level, input load level, and manufacturing types. Inverters with a greater DC-to-AC conversion efficiency (90-95%) draw fewer amps, whereas inverters with a lower efficiency (70-80%) draw more current.

I thought that was a bit odd since $250a \times 12v$ is 3000w so that would indicate the inverter was running at maximum capacity. I changed it for a 300a breaker instead but now when I plug the oven in and turn it on after 30 seconds the inverter trips instead and shuts itself off, presumably the over load protection is kicking in.
