All solar farms connect to a specific point on the electrical grid, the vast network of wires that connects every power generation plant to every home and business that consumes power. That point is called the "point of interconnection," or POI. The POI is different for utility-scale versus community solar scale projects.

Types of Inverters. There are several types of inverters that might be installed as part of a solar system. In a large-scale utility plant or mid-scale community solar project, every solar panel might be attached to a single central inverter. String inverters connect a set of panels--a string--to one inverter. That inverter converts the power produced by the entire string to AC.

Grid-integration technical requirements must be satisfied at commissioning since they govern grid-connected PV systems" design, administration, and operation. These are "grid standards" or technical requirements for the system. Initial needs focused on power quality in rated conditions with maximum power point tracking (MPPT).
