String Combiner Boxes vs. Array Combiner Boxes String Combiner Boxes. A string combiner box is used when you have several strings of solar panels. A "string" is just a series of panels connected. The combiner box takes the power from each string and combines it into one output, which then goes to the inverter.

It is typically used in the larger commercial and utility scale PV power plants (greater than 500kW). The combiner box commonly houses the input overcurrent protection fuse assemblies for several strings (from as few as three strings to as many as 52), as well as the combined bus of those inputs into a single main output.

Strategically placed combiner boxes in solar PV modules can help to reduce power loss. The combiner box should be placed between the modules and the solar inverter to maximize output. Solar combiner boxes improve inverter protection and reliability by safeguarding the system from excessive current and voltage overcharge.
