The way the power capability is measured is in C's. A C is the Amp-hour capacity divided by 1 hour. So the C of a 2Ah battery is 2A. The amount of current a battery "likes" to have drawn from it is measured in C. The higher ...

The output power determines the actual carrying capacity of the outdoor power supply. Or take BPI's new BPS1000M outdoor power supply as an example: its output power is 1000W, and it can load various electrical equipment within 1000W, which is its carrying ...

Introduction to Power Supply. The power supply is an electric instrument that used to deliver electrical energy to the electrical load connected with it.; The basic operation of a power supply is that it transforms electrical current received from the input source to such level of current, voltage and frequency that can operate load.

The general rule of thumb is don't run it more than 80% capacity long term. Just because a supply is listed at 200 Watts doesn't mean it's 200 Watts on the main 12V rail, which is the most important. I'm super conservative about my choices and choose power supplies that are 40% over my required power. I have supplies last 8+ years that way.
