The installed power capacity of China arrived 2735 GW (GW) by the end of June in 2023 (Fig. 1 (a)), which relied upon the rapid development of renewable energy resources and the extensive construction of power grid systems during the past decade [1]. The primary power sources in China consist of thermal power (50 %), hydropower (15 %), wind power (14 %), and ...

Large-scale integration of renewable energy in China has had a major impact on the balance of supply and demand in the power system. It is crucial to integrate energy storage devices within wind power and photovoltaic (PV) stations to effectively manage the impact of large-scale renewable energy generation on power balance and grid reliability.

However, the cost is still the main bottleneck to constrain the development of the energy storage technology. The purchase price of energy storage devices is so expensive that the cost of PV charging stations installing the energy storage devices is too high, and the use of retired electric vehicle batteries can reduce the cost of the PV combined energy storage ...

The \$500 million, 950-MW Al Ezzel Power Plant (Figure 1) was developed by the Ministry of Finance and National Economy as Bahrain's first independent generating station.
