

Types of UPS uninterruptible power supplies in Finland

What is an uninterruptible power supply (UPS)?

All three basic uninterruptible power supply (UPS) technologies have their place in protecting today's distributed IT infrastructure especially on the network edge. Each technology has its advantages and each may be necessary for configuring cost effective power protection, especially in complex systems.

What are the different types of UPS system configurations?

The three major types of UPS system configurations are online double conversion, line-interactive and offline (also called standby and battery backup). These UPS systems are defined by how power moves through the unit. AC power is stable and clean upon generation.

What are the different types of ups?

Judging by the input and output phase voltage, UPS can be categorized into single-phase and three-phase. Single phase UPS can be also referred to as 1 phase or 1-phase. It has a single input and output source to the power equipment using only one sine wave voltage. It contains only two wires to cover the current--one conductor and one neutral.

What is the function of a ups?

The function of a UPS depends on the application's power requirements. In some cases, the UPS provides power only long enough to allow for a safe and orderly system shutdown, preventing data loss or system crashes.

What is a line-interactive UPS system?

Line-interactive UPS systems provide both power conditioning and battery backup. This technology is particularly effective in areas where outages are rare, but power fluctuations are common. Line-interactive UPS systems support a wide range of input voltage fluctuations before switching to battery backup.

What is a line interactive UPS system?

Line interactive UPS systems rely on the battery to condition power so this type tends to drain its battery more frequently than online UPS systems that condition power through the double-conversion process. When AC input power fails, the unit's transfer switch opens and the power flows from the battery to the UPS output.

The three most common types of UPS systems are standby (offline), line-interactive, and online double conversion. Standby UPS. A Standby UPS, also known as an offline UPS, is the simplest type of uninterruptible power supply. But with that simplicity also comes a lack of power conditioning.
