Thermal stores are highly insulated water tanks that can store heat as hot water for several hours. They usually serve two or more functions: Provide hot water, just like a hot water cylinder. Store heat from a solar thermal system or biomass boiler, for providing heating later in the day.; Act as a "buffer" for heat pumps to meet extra hot water demand.

We have a long history of research on energy storage, and a number of dedicated facilities to develop and evaluate potential solutions. At our Stored Energy Integration Facility (SEIF) and our Centre for Hybrid Energy Systems (CHES) we have the capacity to evaluate integrated batteries and develop new energy storage systems.

With major decarbonisation efforts and the scaling up of renewable power generation, the widespread adoption of energy storage continues to be described as the key game changer for electricity systems. Affordable storage systems are a critical missing link between intermittent renewable power and a 24/7 reliability net-zero carbon scenario.

Energy storage is a technology that holds energy at one time so it can be used at another time. Building more energy storage allows renewable energy sources like wind and solar to power more of our electric grid.
